Used when the board length needed for a given application is longer than a one piece unit will normally go. The fixed ramp is made to get up to 50" above the ground. A light weight hinged aluminum board then goes up or down from this 50" height. Board hinges back vertically out of the way so overhead doors can be closed without moving the unit. A good solution for pallet trucks and the low dock situation when the unit does not need to be moved out of the way.
