What size do I need? It is impossible to pick one size that will fit all trucks. But with a little information it is possible to pick a size that should work most of the time for your customer. With a few particulars, we will lay out your truck and make a recommendation as to how high to make the riser for the best fit. Here are some of the items we will need to intellegently make a recommendation.

Of course, if the ground in front of the dock is not level, we will also need information on how it slopes.

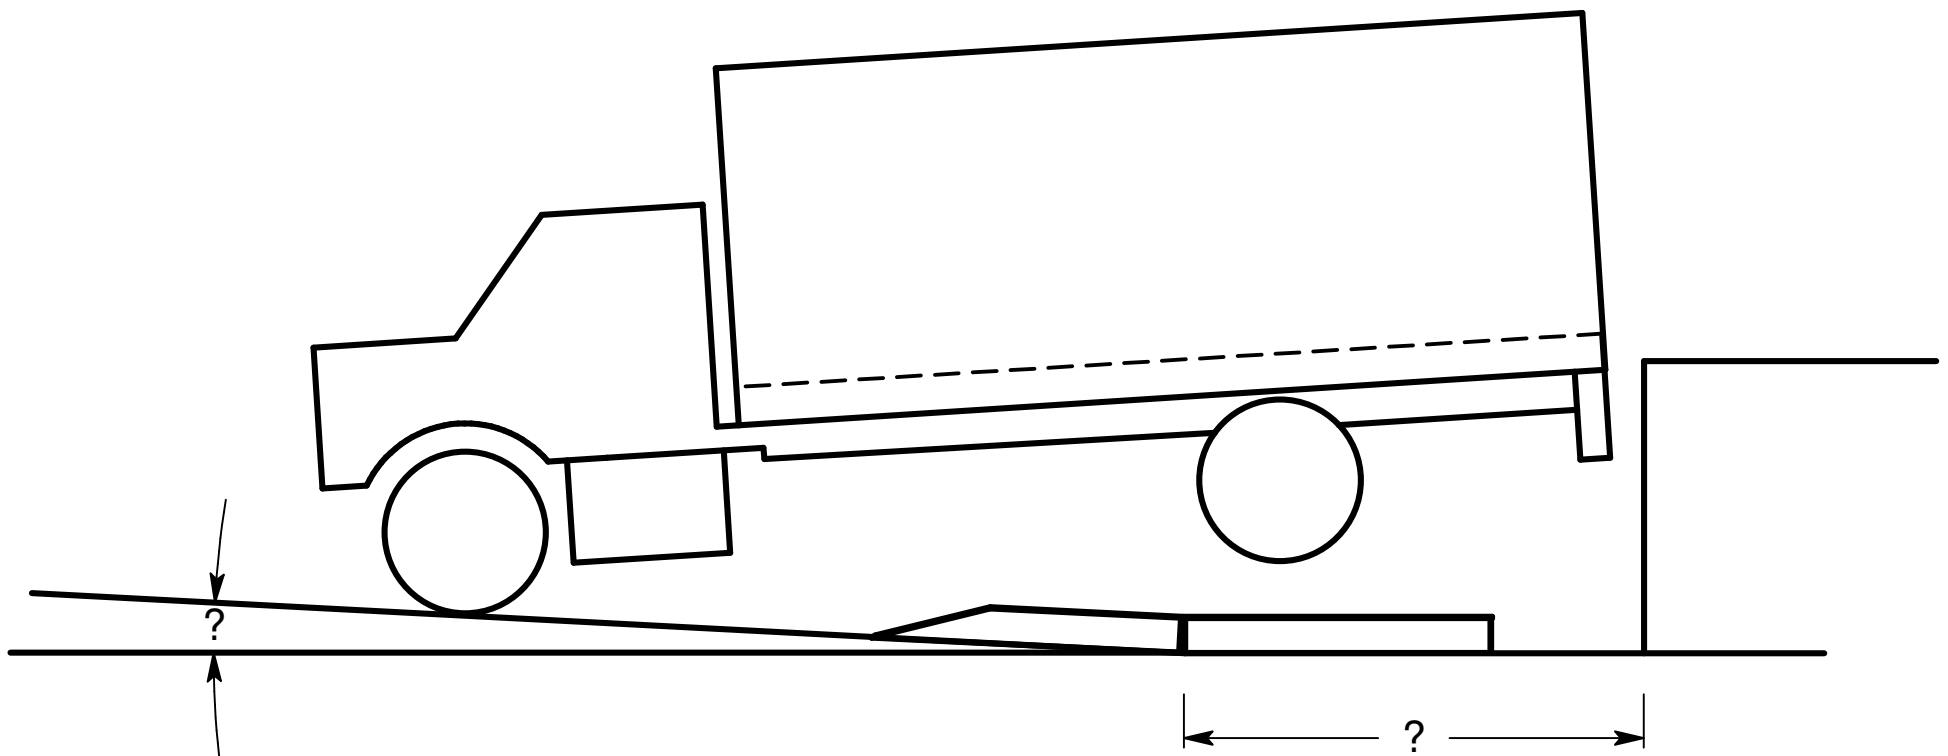

This information is needed to determine exactly how high the back end will be raised when we make a certain height riser.

For example if we raise the rear wheels up 12" the back end may go up as high as 18". Without some information we are just guessing.

Is area in front of dock level? Or does it slope upward as shown.
If it is not level we need to have some idea of where the slope starts and how much. If it does we may need to make the riser in two sections as shown.

How high do risers need to be to raise back end of truck 2-3" higher than dock?
